Abstract

- The **Travel Package Booking Portal** is a web-based application that allows users to discover, compare, book, and manage travel packages through a single platform.
- It provides destination details, itineraries, pricing, interactive maps, recommendations, booking history, and secure online payment.
- The system benefits travelers and travel agencies by simplifying travel planning, reservation handling, and payment tracking.

Problem Statement & Objectives

- **Problem:** Traditional travel planning requires users to access multiple platforms for destinations, packages, itineraries, bookings, maps, and payments.
- **Objective 1:** Provide a single platform to browse and compare travel packages.
- **Objective 2:** Enable online booking, payment processing, and booking-history management.
- **Objective 3:** Provide interactive maps, destination information, and package recommendations.
- **Scope:** Customers, travel agencies/admins, travel packages, destinations, reservations, payments, and location-based services.

Existing vs Proposed System

Feature	Existing System	Proposed System
Package discovery	Multiple platforms	Single portal
Package comparison	Limited/separate	Compare packages in one platform
Booking	Separate processes	Integrated online booking
Payment	Separate payment process	Integrated secure payment
Management	Manual/separate handling	Centralized package, reservation & payment management

Feasibility Study

- Technical:**
- Uses React.js, Node.js, Express.js, MySQL, Mapbox and payment gateway integration.
- Economic:**
- Uses commonly available web-development technologies and development tools.
- Operational:**
- Provides a responsive and user-friendly interface for customers and travel agencies.
- Schedule:**
- The project is designed as a full-stack web application that can be developed within the academic project timeline.

Results & Testing

- Successful implementation of the travel package booking workflow.
- Functional modules include package browsing, destination viewing, booking management, payment processing, and booking history.
- System functionality can be validated through user interaction, booking validation, database operations, and transaction processing.

Conclusion

- Developed a centralized **Travel Package Booking Portal** for discovering, comparing, booking, and managing travel packages.
- The system integrates package management, reservations, maps, recommendations, and online payments.
- It provides a scalable and efficient solution for travelers and travel agencies.

Future Scope

- Enhanced **personalized package recommendations** based on user preferences and booking history.
- Additional **location-based services** and travel-related integrations.
- Further expansion of **payment and travel-service integrations**.

Tools & Technologies

- Front-End: React / HTML-CSS-JS
- Back-End: Node.js / Spring Boot / Django + REST APIs
- Database: MySQL / PostgreSQL / MongoDB
- Tools: Git & GitHub, Postman, VS Code, Draw.io
